Creating a form application in Visual Studio.

Select New Project from menu. You can select **File > New > Project**.

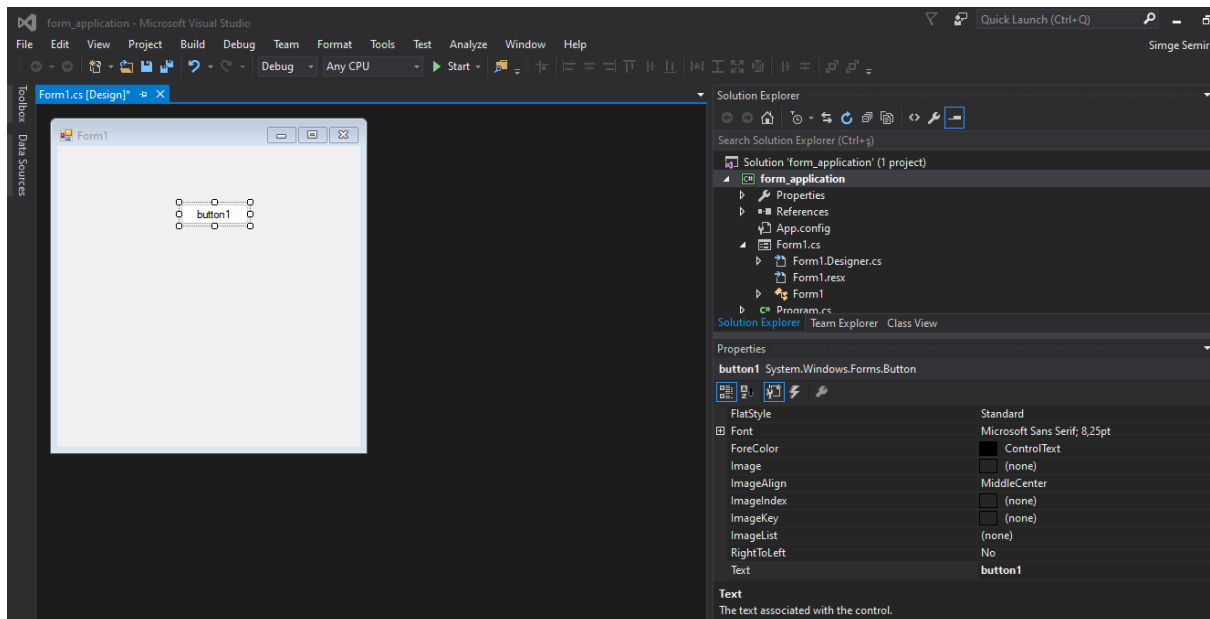

Then, you should select Windows Forms Application. You can enter a name for your Project. Then click OK.

When application is ready, you can use Toolbox to add a necessary tool for your GUI. If Toolbox is not opened on the left-hand side of the screen, you can open it from **View > Toolbox**. (Ctrl + Alt + X)

After you drag and drop a tool from Toolbox (such as a button), you can click on that tool and change some properties of the button. Properties window should be on the right-hand side of the screen. If it is not seen, you can open properties window from **View > Properties Window**.

You can change Text property or Name property of the button from Properties Window.
